Allowable Subject Matter

Claims 1, 27-29, and 31-34 are allowed.

The following is a statement of reasons for the indication of allowable subject matter:

The claims are allowed because of the filed Remarks and because the prior arts of record fail to teach the following underlined limitations in combination with all the remaining limitations.

1. (Previously Presented) A high-speed wireless data system for providing services for terminals of either a public wireless network or a private wireless network, the system comprising:

a first hub configured to relay data between a private base station in the private wireless network, a private base station controller in the private wireless network, a private packet data service node, a private authentication system and a second hub, to receive a call connection request signal from a terminal through the private base station, to compare a server address included in an Unicast Access Terminal Identifier (UATI) assigned to the terminal with a set of server addresses pre-stored in the first hub, to transmit the call connection request signal to the private base station controller when a server address included in the Unicast Access Terminal Identifier (UATI) assigned to the terminal is among the set of server addresses pre-stored in the first hub, and to transmit the call connection request signal to a second hub when said sever address included in the Unicast Access Terminal Identifier (UATI) is not among the set of server addresses pre-stored in the first hub;

the second hub connected to a public base station, a public base station controller,

Art Unit: 2617

a data location register and a public network packet data service node while being connected to the first hub, the second hub receiving the call connection request signal of the terminal from the first hub and transmitting the call connection request signal to the public network base station controller; and

the data location register assigning the Unicast Access Terminal Identifier corresponding to the terminal, when the terminal enters a service area of the private base station.

32. (Previously Presented) A method in a high-speed wireless data system, the method comprising the steps of:

storing a plurality of server addresses in a first hub, with the first hub being communicatively connected with at least one private base station in a private network, a private base station controller in the private wireless network controlling the at least one private base station, a private packet data service node, a private authentication system and a second hub, the second hub being communicatively connected with a public base station in a public network, a public base station controller, a data location register, and a public network packet data service node, and the private base station servicing a service area and the data location register assigning an Unicast Access Terminal Identifier (UATI) to each of a plurality of mobile terminals located within the service area, with the UATI containing a server address;

receiving an access request signal, from a mobile terminal at a private base station servicing a service area where the mobile terminal is located, with the access request signal comprising a destination address and an UATI of the mobile terminal;

transmitting the access request signal from the private base station to the first hub according to the Internet protocol (IP) communication protocol;

making a determination, at the first hub, regarding whether the server address contained in the UATI received from the mobile terminal is among the plurality of server addresses stored in the first hub;

when the server address contained in the UATI received from the mobile terminal is among the plurality of server addresses stored in the first hub, transmitting the access request signal via the first hub to the private base station controller according to the Internet protocol (IP) communication protocol; and

when the server address contained in the UATI received from the mobile terminal is not among the plurality of server addresses stored in the first hub, transmitting the access request signal via the first hub to the second hub according to the Internet protocol (IP) communication protocol.
